

Saransh Kumar

lunaticdevs1337@gmail.com | XXXXXXXXXX

EDUCATION

Amity University, Noida

Bachelor of Technology
Computer Science & Engineering
July 2019 - May 2023
Cum. CGPA: 8.41, Major GPA: 9

SKILLS

Java • JavaScript • Golang
Spring Boot • Hibernate • Drools
Apache Maven • Git • GitHub
RabbitMQ • MySQL • Redis
JUnit • GitHub Actions • AWS
Shell scripting • Linux • Docker
Jenkins • Vue.js • Python
Microservice Architecture
Data structures & Algorithms
Opencode • Agentic Development

COURSEWORK

Advance Java Programming
Software Architecture & Design
Advanced Network Solution
Machine Learning with Python
Cyber Security

PUBLICATIONS

Design of cloud based video sharing platform using Machine Learning ([paper link](#))
Comparing Deep Learning and Traditional ML for Detecting Spam and Trolls on Video Sharing Sites ([paper link](#))

ACHIEVEMENTS

Employee of the month at **LoadShare Networks** for the month of Feb, 2024.
Participated in **Smart India Hackathon 2022 Grand Finals**.

CERTIFICATIONS

Spring Framework 5
Java Programming
Masterclass
Linux For Developers

WORK EXPERIENCE

LoadShare Networks | Software Development Engineer - 2

July 2023 - Present

- Worked across multiple systems, including a **rule engine, grievance management, payouts, onboarding, order allocation, and data processing pipelines**.
- Owned and architected a rule engine service powering earnings, incentives, and payouts for **30K+ riders** across **hyperlocal** and **quick commerce** segments.
- Scaled the rule engine from **50K to 300K+ daily orders**, reduced deployment stabilization time from **30 minutes to 3 minutes**, and optimized DB queries in a highly configurable system with **10K+ active rules**.
- Created a **platform for rule management** from scratch, supporting versioning, testing, and deployment of DMN-based business rules across teams and environments.
- Developed a **Java-based incentive evaluation system**, processing **2M+ requests per day** with real-time progress tracking for daily, weekly, joining and rejoining incentives.
- Engineered extensible earnings and referral systems using **design patterns**, enabling rapid client onboarding (e.g., Amazon Now, Pincode) and driving a **15% increase in referrals and a 25% increase in revenue**.
- Built a **state machine-driven grievance management microservice**, reducing **issue resolution time by 35%** through automated workflows.
- Developed a **flexible workflow framework** with **GitHub** and **Jenkins** integration, streamlined rate card deployments, reduced production errors and manual effort.
- Led **end-to-end service ownership** (design, development, deployment and production support), mentored 3 engineers, and drove key architectural decisions.
- Tech Stack: **Java, Python, Typescript, Spring Boot, Hibernate, Drools, Vue.js, MySQL, PostgreSQL, AWS, GitHub Actions, Redis, JUnit, Apache Maven, Docker**

Amadeus | Software Engineer Intern

February 2023 - June 2023

- Integrated OpenAPI specification in API generation flow. Wrote a pipeline to deploy the API in the **Azure Function App** using **GitHub Actions, Terraform, and Terragrunt**.

LoadShare Networks | Software Engineer Intern

June 2022 - September 2022

- Designed a COD microservice and APIs for zone configuration management, enabling the system to accept COD orders and increasing **order volume by 30%**.

PROJECTS

Themis | DMN Rule Management Platform

Demo video

- Engineered a multi-tenant platform for managing rule, decision and rate-card at scale.
- Architected the backend using **hexagonal architecture, JWT-based authentication, and RBAC** authorization for secure, governed access.
- Designed a flexible **DMN** and **Git**-backed rules system supporting search, validation, simulation, publishing, rollback, and reusable decision models.
- Automated artifact build and deployment workflows across **AWS-based** runtime environments, improving release reliability and operational visibility.
- Accelerated product delivery through **agentic coding** workflows, helping build Nuxt frontend features alongside backend platform engineering.

Tech stack: Java, Spring Boot, Spring Security, PostgreSQL, Drools, AWS, Nuxt 4, Vue 3, Docker, GitHub Actions, Large Language Model

Serpent Clash

Demo video | Live | GitHub

- Built a multiplayer snake game with an authoritative server for consistent state.
- Used **ECS** architecture for efficient, scalable and modular game logic.
- Implemented a tick-based system using goroutines and channels for deterministic updates, and optimized collision detection with **quadtree** spatial partitioning.
- Added server reconciliation and interpolation for smooth gameplay.

Tech stack: Golang, WebSocket, Vue.js, Pixi.js, HTML Canvas, Tailwind CSS, Docker
